

Resurfacing Concrete Carriageways

Miles Macadam manufacture and install HAPAS certificated Grouted Macadam surfacing materials, which provide a superior treatment to problem sites.

MILEPAVE™ is an **Asphalt Grouted Macadam Surface Course**. It is unique as it incorporates and connects two distinct categories of road surface treatment. Combining the attributes of Micro-asphalt or Slurry Surfacing with Conventional Surfacing, the positive properties of each can be utilised.

For over 20 years, Miles Macadam has installed a system for resurfacing concrete roadways. **MILEPAVE™** has a number of unique properties that ensure long term successful treatment.

- **Impervious**
- **High Strength**
- **Flexibility**

Pre-treatment of the concrete joints seals the surface against water ingress and counters thermal movement and the post treatment of the movement joints encourages reflective cracking to come through pre-induced routes to maintain surface integrity.

An example below shows the effectiveness of the post treatment option.

MILEPAVE™ can be laid at 30mm or 40mm and the warranty with the **MILEPAVE™** system includes yearly inspection and maintenance of the joints.

Miles Macadam has an extensive client base utilising this service and a long and established track record.
